**RV-2019-02**

## Introduction

X-ray fluorescence analysis is a frequently used technique for the analysis of oxidic materials.

However, for the calibration of XRF instruments, dedicated standard material is needed. As a worldwide supplier for XRF laboratories, FLUXANA has developed a number of services to support XRF users. One of these services is the production of new reference materials and the organization of proficiency tests (PT).

In 2011, FLUXANA introduced its own quality management.

In February 2014, FLUXANA received accreditation from the German DAKKS according to DIN EN ISO/IEC 17025:2005 for the test laboratory in Bedburg-Hau.

The production of reference materials and the performance of proficiency tests is not yet accredited. However, the proficiency tests are conducted following the corresponding norms.

All evaluations are performed in agreement with DIN EN ISO/IEC 17043:2010, DIN EN ISO 17034:2017 and ISO Guide 35:2017.

## Outliers

Outliers in the statistical sense are typically not detected when using robust statistical methods because the robust A+S algorithms were found to work better than the classical approach (which is outlier detection plus arithmetic mean and classical s.d. formula). Outliers shown in the evaluation are only based on z-scores and marked with yellow or red colours.

## Further Information

All laboratory data is listed in the following evaluation report. Additional information about laboratory accreditation and analytical methods used is also provided. Calculation was done only on traceable methods.

The laboratory performance is shown based on z-scores. The diagrams show the laboratory data in comparison with the calculated mean values.

## Statistical Evaluation used for this PT

### Calculation of Mean m

The mean  $m$  for all laboratories is calculated using the Hampel estimator (ISO/TS 20612:2007 9.2.3) based on the laboratory means  $\mu$  using traceable methods only.

### Calculation of reproducibility standard deviation $s_R$

The reproducibility standard deviation  $s_R$  is calculated using the Q-method (ISO/TS 20612:2007 9.2.3).

### Calculation of repeatability standard deviation $s_r$

The repeatability standard deviation  $s_r$  is also calculated using the Q-method.

### Calculation of robust standard deviation $s^*$

The robust standard deviation  $s^*$  is calculated from the laboratory means  $\mu$  using the Q-method.

### Calculation of uncertainty $U_{s_R}$ (according to Nordtest TR 537 ed 3.1.)

The **uncertainty  $U_{s_R}$**  for a confidence interval of  $P=95\%$  ( $k=2$ ) can be calculated from the **reproducibility standard deviation  $s_R$**  (factor 1.25 for average median, robust statistics) and the number of participating laboratories  $p$ :

$$U_{s_R} = 2 * 1.25 * \frac{s_R}{\sqrt{p}}$$

### Calculation of uncertainty $U_{s^*}$ (according to ISO 13528:2015)

The **uncertainty  $U_{s^*}$**  for a confidence interval of  $P=95\%$  ( $k=2$ ) can be calculated from the **robust standard deviation  $s^*$**  (factor 1.25 for average median, robust statistics)) and the number of participating laboratories  $p$ :

$$U_{s^*} = 2 * 1.25 * \frac{s^*}{\sqrt{p}}$$

**RV-2019-02**

The **uncertainty  $U_{s^*}$**  only takes the between laboratories uncertainty into account while the **uncertainty  $U_{s_R}$**  also includes the within laboratories uncertainty. Therefore  $U_{s_R}$  is recommended for use in accredited laboratories.

### Laboratory performance

Laboratory proficiency assessment is based on z-scores.

The **z-score**  $z$  is calculated from all laboratory means  $\mu$ :

$$z = \frac{m - \mu}{s_R}$$

$m$	Mean value for all laboratories (assigned value)
$\mu$	Mean value of individual laboratory
$s_R$	Reproducibility standard deviation

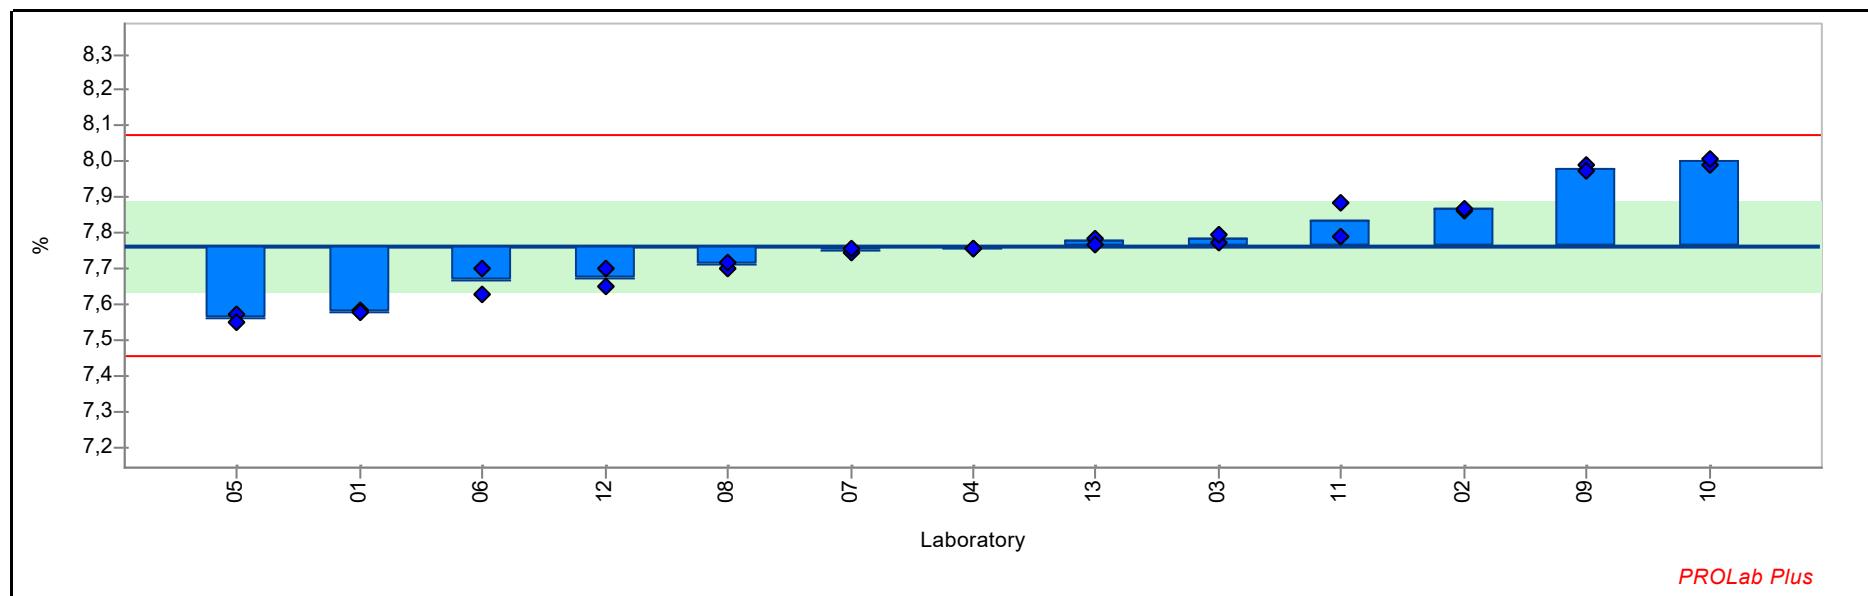

### Assessment on z-scores:

$ z  \leq 2.0$	indicates "satisfactory" performance = generates no signal
$2.0 <  z  < 3.0$	indicates "questionable" performance = generates a warning signal
$ z  \geq 3.0$	indicates "unsatisfactory" performance = generates an action signal

Z-scores with  $3 \geq |z| \geq 2$  are highlighted with a yellow color, z-scores with  $|z| \geq 3$  are highlighted with a red color.
